

# Diffractive Cross Sections Implemented in PYTHIA8-MBR vs LHS Results

Konstantin Goulianatos  
The Rockefeller University  
<http://physics.rockefeller.edu/dino/my.html>

The International Workshop on  
 Physics

**May 30 - June 4, 2013, Israel**

Weizmann Institute of Science, Rehovot; Hotel King Solomon, Eilat

**<http://www.weizmann.ac.il/conferences/lowX/>**

# CONTENTS ♥

- **Total pp cross section:** predicted in a unitarized parton model approach, which does not employ eikonalization and does not depend on the  $\rho$ -value.
- **Diffractive cross sections:**
  - SD - single dissociation: one of the protons dissociates.
  - DD - double dissociation: both protons dissociate.
  - CD – central diffraction: neither proton dissociates, but there is central diffractive production of particles.
- **Triple-Pomeron coupling:** uniquely determined.

→ For details see ICHEP 2012, 6 July 2012, **arXiv:1205.1446** (talk by Robert Ciesielski and KG).

♥ This is an updated version of a talk presented in DIS-2013.

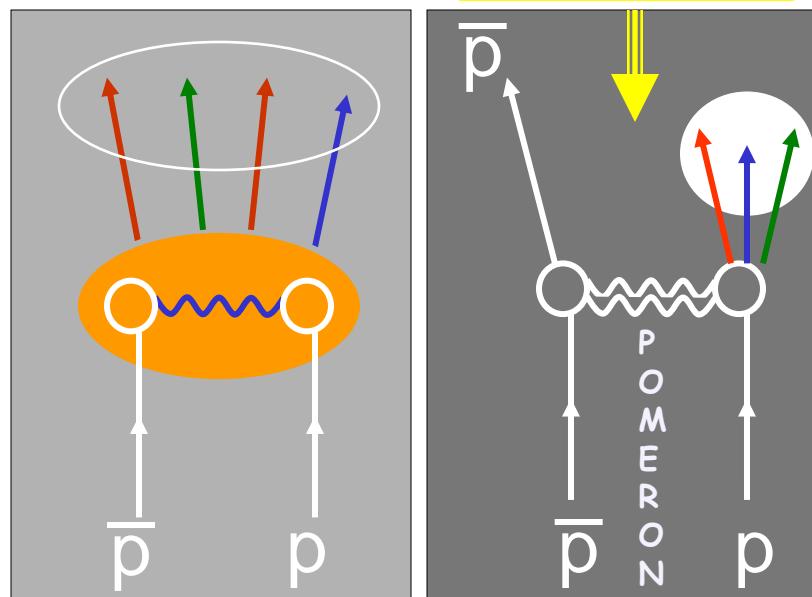

# DIFFRACTION IN QCD

## Non-diffractive events

- ❖ color-exchange →  $\eta$ -gaps exponentially suppressed

## Diffractive events

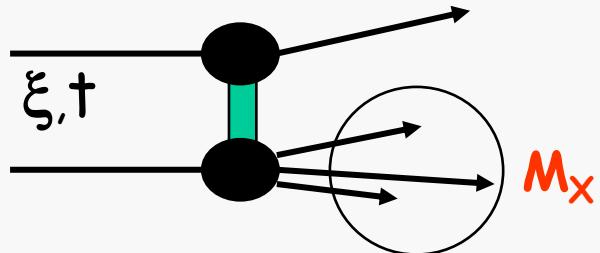

- ❖ Colorless vacuum exchange
- $\eta$ -gaps not suppressed

Goal: probe the QCD nature of the diffractive exchange

# DEFINITIONS

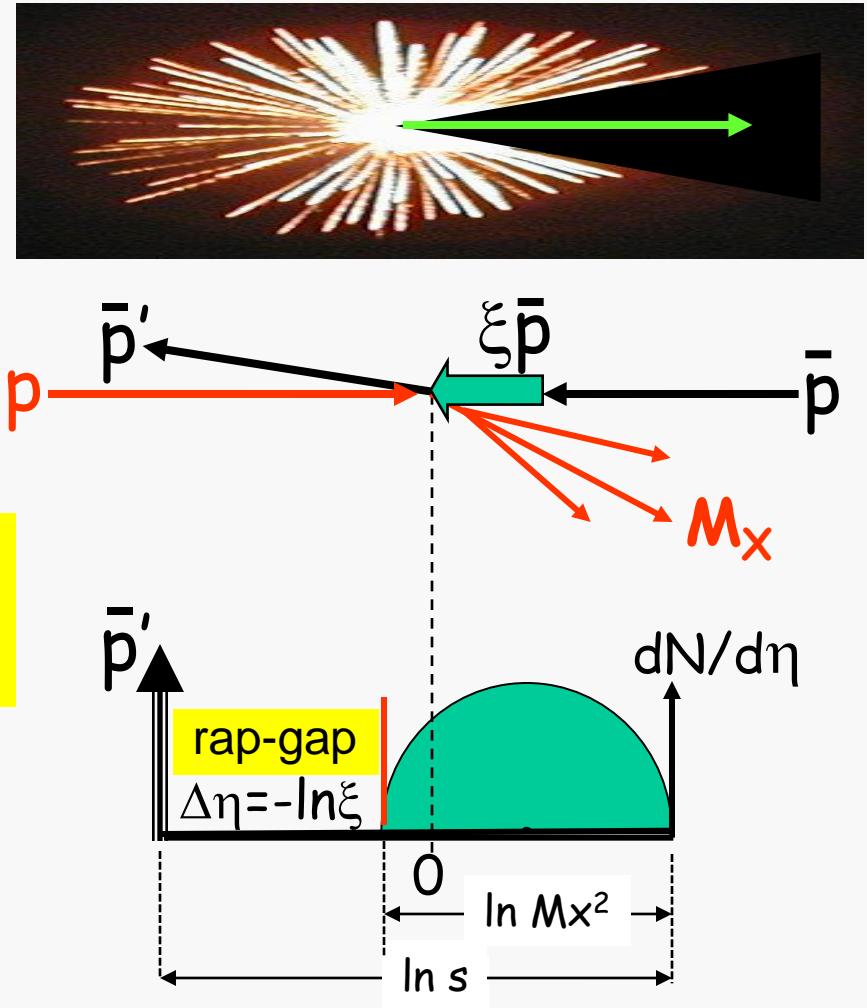

## SINGLE DIFFRACTION

$$1 - x_L \equiv \xi = \frac{M_X^2}{s}$$

Forward momentum loss

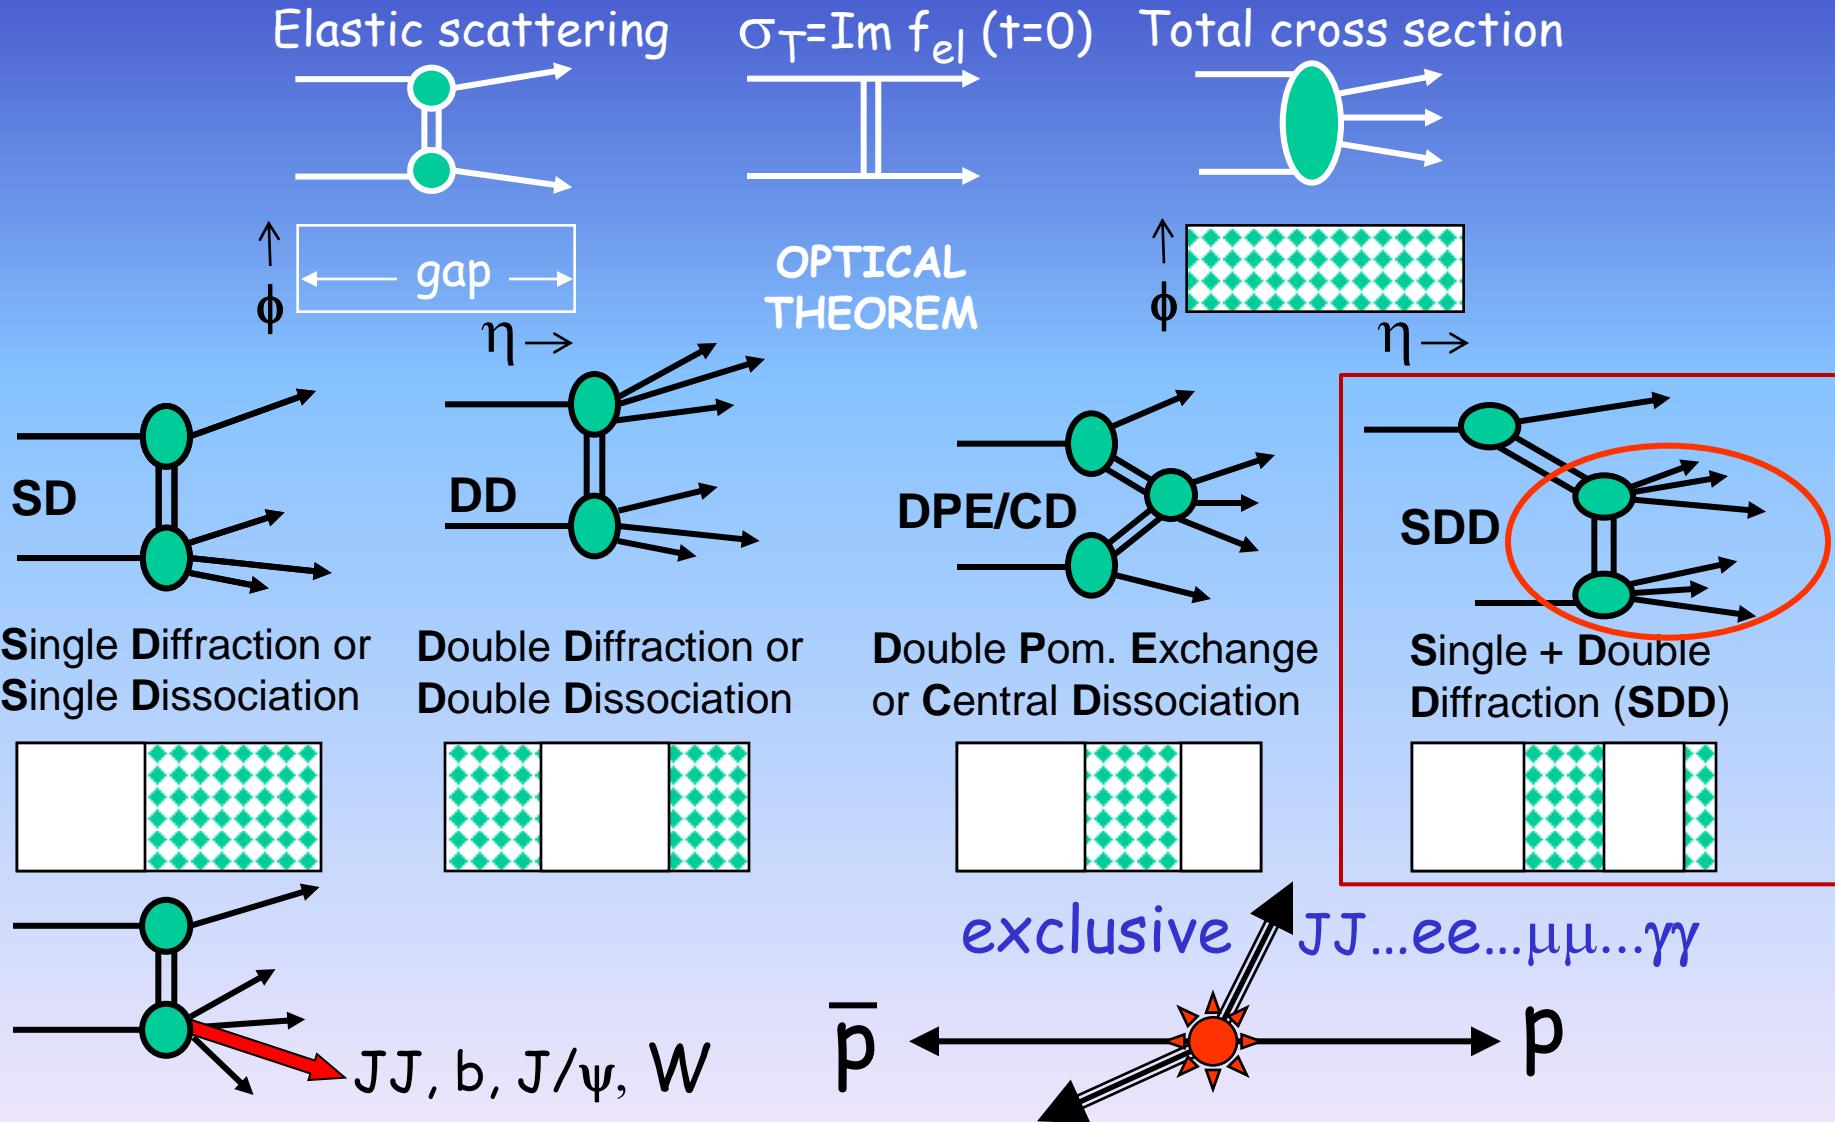

$$\xi^{CAL} = \frac{\sum_{i=1}^{\text{all}} E_T^{\text{i-tower}} e^{-\eta_i}}{\sqrt{s}}$$

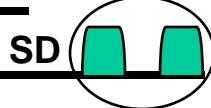

**since no radiation →**  
no price paid for increasing  
diffractive-gap width

$$\left( \frac{d\sigma}{d\Delta\eta} \right)_{t=0} \approx \text{constant} \Rightarrow \frac{d\sigma}{d\xi} \propto \frac{1}{\xi} \Rightarrow \frac{d\sigma}{dM^2} \propto \frac{1}{M^2}$$

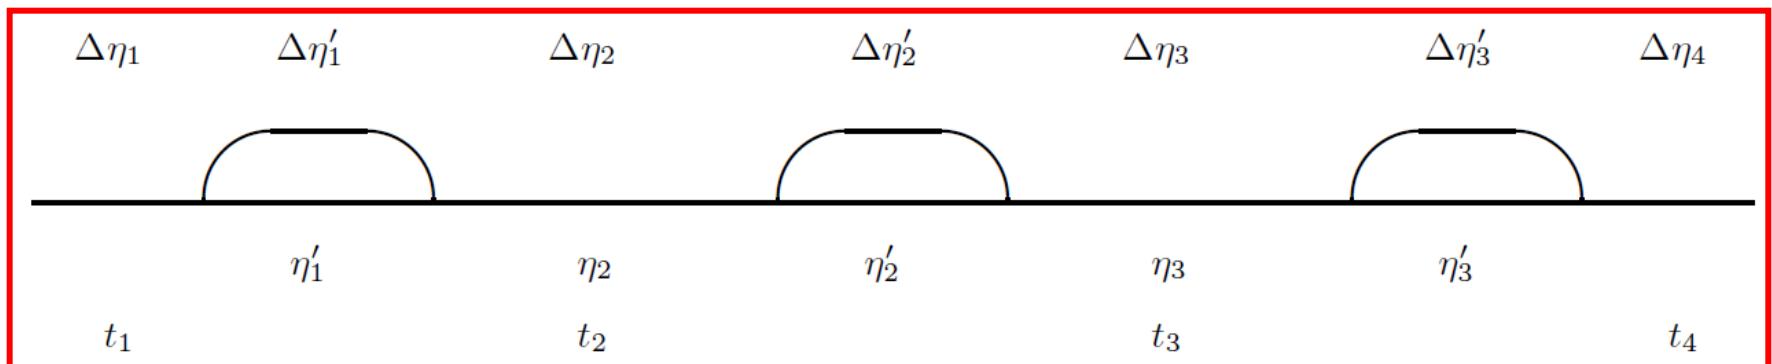

# DIFFRACTION AT CDF

# Basic and combined diffractive processes

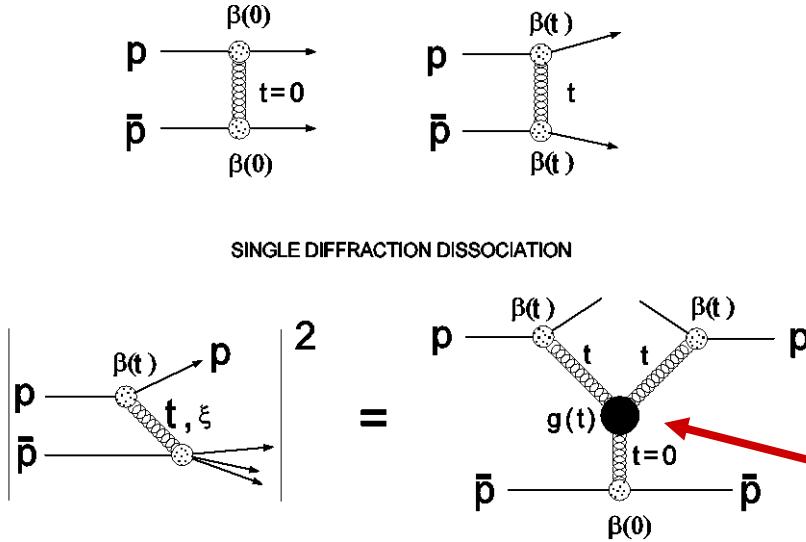

acronym	basic diffractive processes	
$\text{SD}_{\bar{p}}$	$\bar{p}p \rightarrow \bar{p} + \text{gap} + [p \rightarrow X_p],$	
$\text{SD}_p$	$\bar{p}p \rightarrow [\bar{p} \rightarrow X_{\bar{p}}] + \text{gap} + p,$	
$\text{DD}$	$\bar{p}p \rightarrow [\bar{p} \rightarrow X_{\bar{p}}] + \text{gap} + [p \rightarrow X_p],$

# Regge theory – values of $s_0$ & $g_{PPP}$ ?

KG-PLB 358, 379 (1995)

- Parameters:
- $s_0$ ,  $s_0'$  and  $g(t)$
  - set  $s_0' = s_0$  (universal IP)
  - determine  $s_0$  and  $g_{PPP}$  – how?

$$\alpha(t) = \alpha(0) + \alpha' t \quad \alpha(0) = 1 + \epsilon$$

$$\sigma_T = \beta_1(0) \beta_2(0) \left( \frac{s}{s_0} \right)^{\alpha(0)-1} = \sigma_0^{p\bar{p}} \left( \frac{s}{s_0} \right)^{\epsilon} \quad (1)$$

$$\begin{aligned} \frac{d\sigma_{el}}{dt} &= \frac{\beta_1^2(t) \beta_2^2(t)}{16\pi} \left( \frac{s}{s_0} \right)^{2[\alpha(t)-1]} \\ &= \frac{\sigma_T^2}{16\pi} \left( \frac{s}{s_0} \right)^{2\alpha't} F^4(t) \approx \frac{\sigma_T^2}{16\pi} e^{b_{el}(s)t} \end{aligned} \quad (2)$$

$$F^4(t) \approx e^{b_{0,el}t} \Rightarrow b_{el}(s) = b_{0,el} + 2\alpha' \ln \left( \frac{s}{s_0} \right) \quad (3)$$

$$\begin{aligned} \frac{d^2\sigma_{sd}}{dt d\xi} &= \frac{\beta_1^2(t)}{16\pi} \xi^{1-2\alpha(t)} \left[ \beta_2(0) g(t) \left( \frac{s'}{s'_0} \right)^{\alpha(0)-1} \right] \\ &= f_{p/p}(\xi, t) \sigma_T^{p\bar{p}}(s', t) \end{aligned} \quad (4)$$

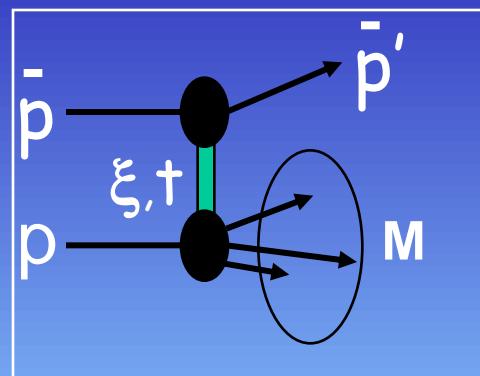

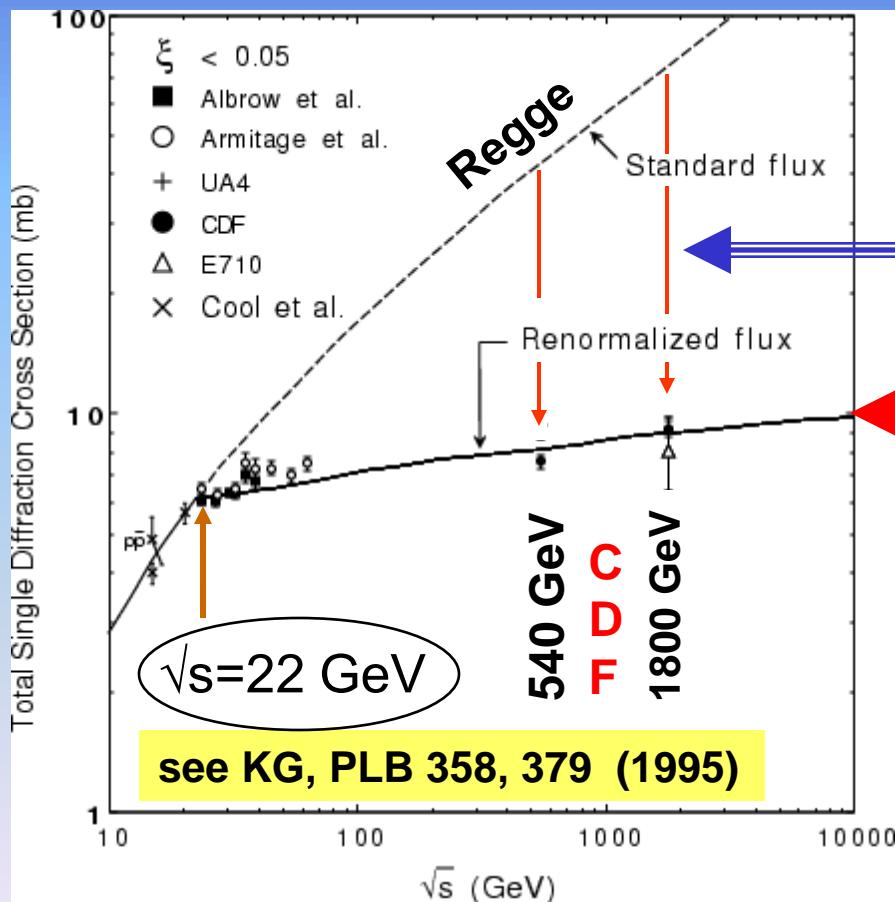

# A complication ... → Unitarity!

$$\left(\frac{d\sigma_{el}}{dt}\right)_{t=0} \sim \left(\frac{s}{s_o}\right)^{2\epsilon}, \quad \sigma_t \sim \left(\frac{s}{s_o}\right)^\epsilon, \quad \text{and} \quad \sigma_{sd} \sim \left(\frac{s}{s_o}\right)^{2\epsilon}$$

- $\sigma_{sd}$  grows faster than  $\sigma_t$  as  $s$  increases \*  
→ unitarity violation at high  $s$   
(similarly for partial x-sections in impact parameter space)
- the unitarity limit is already reached at  $\sqrt{s} \sim 2 \text{ TeV} !$
- need unitarization

# FACTORIZATION BREAKING IN SOFT DIFFRACTION

→ diffractive x-section suppressed relative to Regge prediction as  $\sqrt{s}$  increases

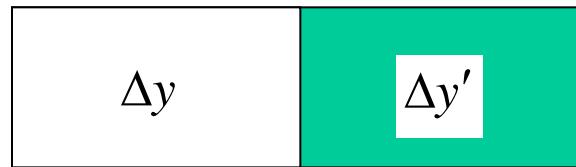

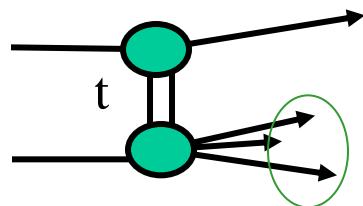

Factor of ~8 (~5)  
suppression at  
 $\sqrt{s} = 1800$  (540) GeV

**RENORMALIZATION**

Interpret flux as gap formation probability  
that saturates when it reaches unity

# Single diffraction renormalized - 1

KG → CORFU-2001: <http://arxiv.org/abs/hep-ph/0203141>

2 independent variables:  $t, \Delta y$

$$\frac{d^2\sigma}{dt d\Delta y} = C \cdot F_p^2(t) \cdot \underbrace{\left\{ e^{(\varepsilon + \alpha' t)\Delta y} \right\}^2}_{\text{gap probability}} \cdot \underbrace{\kappa \cdot \left\{ \sigma_o e^{\varepsilon \Delta y'} \right\}}_{\text{sub-energy x-section}}$$

color factor

$$\kappa = \frac{g_{IP-IP-IP}(t)}{\beta_{IP-p-p}(0)} \approx 0.17$$

gap probability

sub-energy x-section

Gap probability → (re)normalize to unity

# Single diffraction renormalized - 2

color factor

$$\kappa = \frac{g_{IP-IP-IP}(t)}{\beta_{IP-p-p}(0)} \approx 0.17$$

Experimentally:

KG&JM, PRD 59 (114017) 1999

$$\kappa = \frac{g_{IP-IP-IP}}{\beta_{IP-p}} = 0.17 \pm 0.02, \quad \varepsilon = 0.104$$

QCD:  $\kappa = f_g \times \frac{1}{N_c^2 - 1} + f_q \times \frac{1}{N_c} \xrightarrow{Q^2 = 1} \approx 0.75 \times \frac{1}{8} + 0.25 \times \frac{1}{3} = 0.18$

# Single diffraction renormalized - 3

$$\frac{d^2\sigma_{sd}(s, M^2, t)}{dM^2dt} = \left[ \frac{\sigma_o}{16\pi} \sigma_{IP}^\circ \right] \frac{s^{2\epsilon}}{N(s, s_o)} \frac{e^{bt}}{(M^2)^{1+\epsilon}}$$

$$b = b_0 + 2\alpha' \ln \frac{s}{M^2} \quad s_o^{\text{CMG}} = (3.7 \pm 1.5) \text{ GeV}^2$$

$$N(s, s_o) \equiv \int_{\xi_{\min}}^{\xi_{\max}} d\xi \int_{t=0}^{-\infty} dt f_{IP/p}(\xi, t) \xrightarrow{s \rightarrow \infty} s_o^\epsilon \frac{s^{2\epsilon}}{\ln s}$$

$$\frac{d^2\sigma_{sd}(s, M^2, t)}{dM^2dt} \xrightarrow{s \rightarrow \infty} \sim \ln s \frac{e^{bt}}{(M^2)^{1+\epsilon}}$$

$$\sigma_{sd} \xrightarrow{s \rightarrow \infty} \sim \frac{\ln s}{b \rightarrow \ln s} \Rightarrow const$$

set to unity  
 → determines  $s_o$

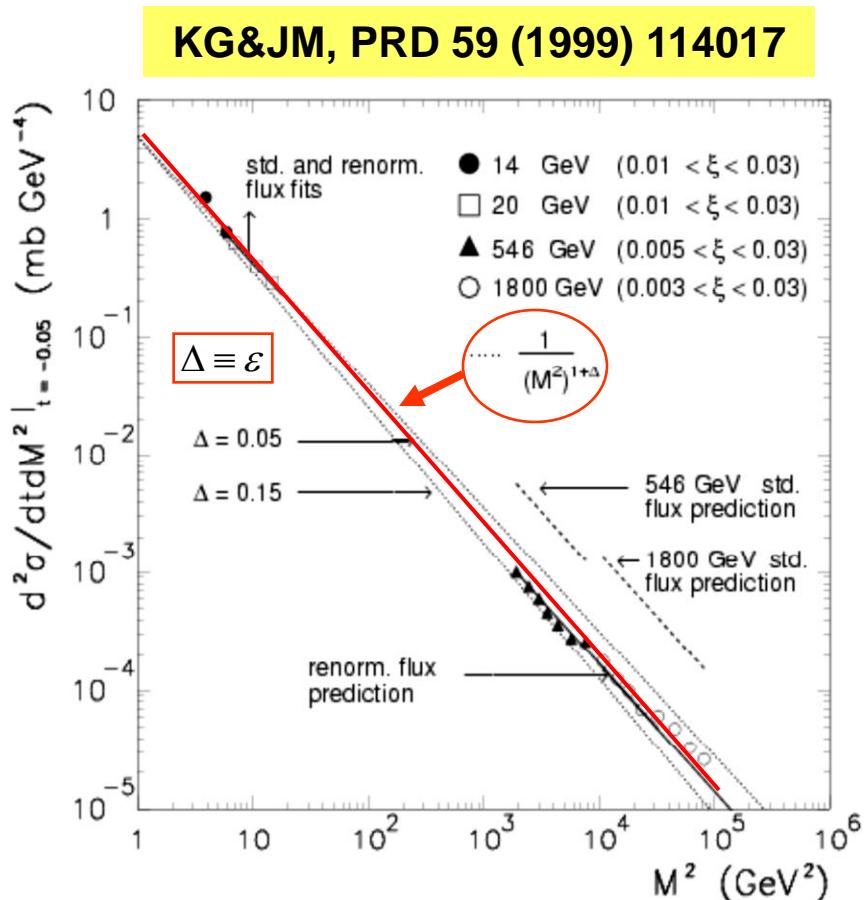

# $M^2$ distribution: data

→  $d\sigma/dM^2|_{t=-0.05} \sim$  independent of  $s$  over 6 orders of magnitude!

Regge

$$\frac{d\sigma}{dM^2} \propto \frac{S^{2\epsilon}}{(M^2)^{1+\epsilon}}$$

Independent of  $S$  over 6  
orders of magnitude in  $M^2$   
→  $M^2$  scaling

→ factorization breaks down to ensure  $M^2$  scaling!

# Scale $s_0$ and $PPP$ coupling

Pomeron flux: interpret as gap probability

→ set to unity: determines  $g_{PPP}$  and  $s_0$

KG, PLB 358 (1995) 379

$$\frac{d^2\sigma_{SD}}{dt d\xi} = f_{IP/p}(t, \xi) \sigma_{IP/p}(s\xi)$$

$\downarrow s_0^\varepsilon$

$\uparrow s_0^{-\varepsilon/2} \cdot g_{PPP}(t)$

Pomeron-proton x-section

- Two free parameters:  $s_0$  and  $g_{PPP}$
- Obtain product  $g_{PPP} \cdot s_0^{\varepsilon/2}$  from  $\sigma_{SD}$
- Renormalized Pomeron flux determines  $s_0$
- Get unique solution for  $g_{PPP}$

# Saturation at low $Q^2$ and small- $x$

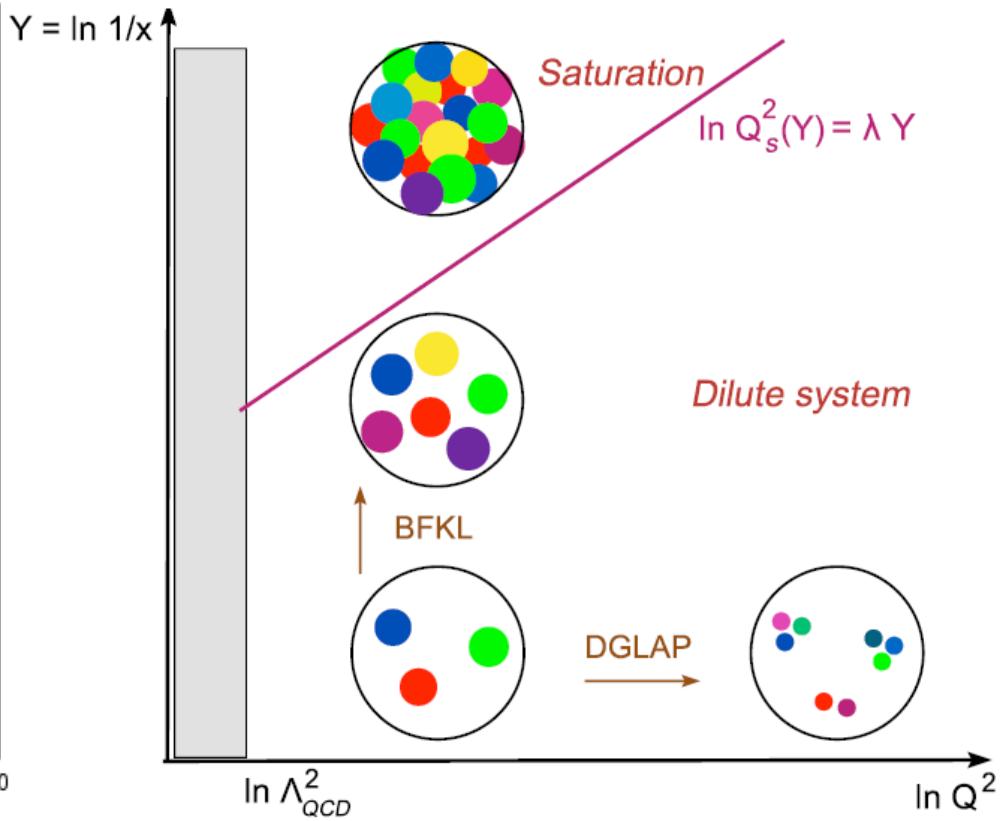

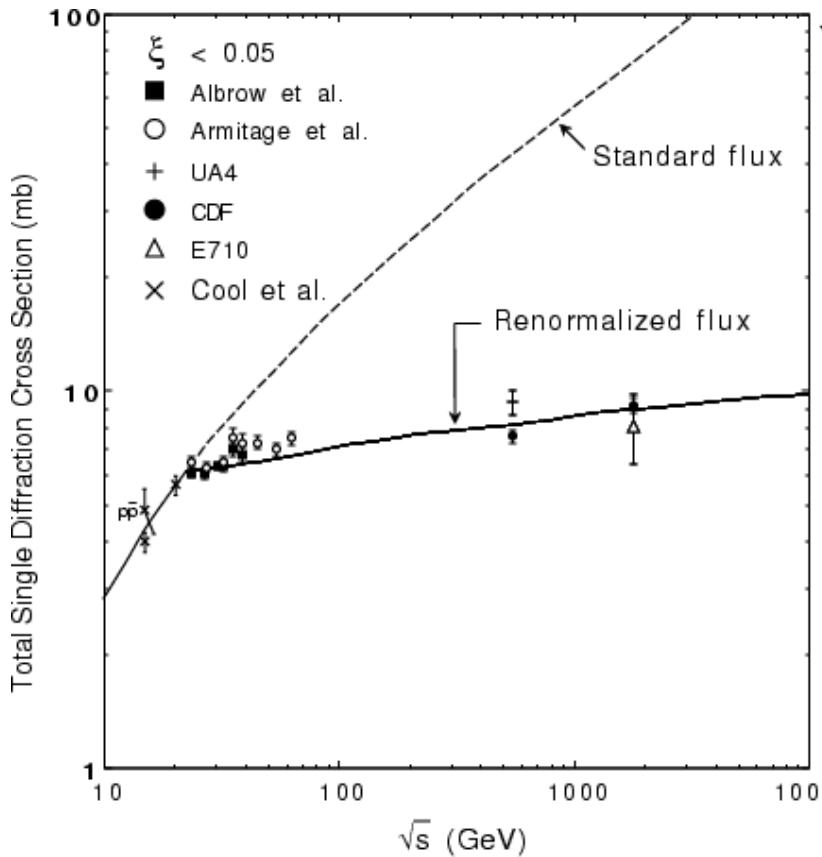

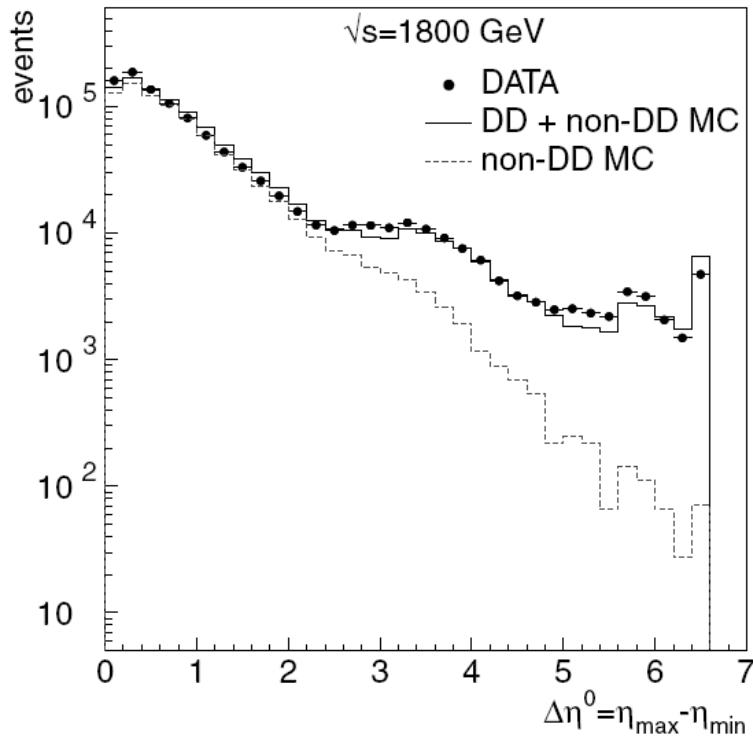

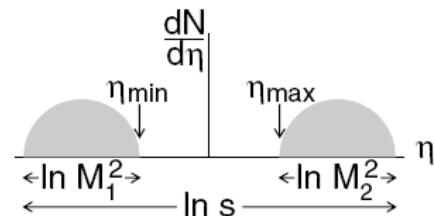

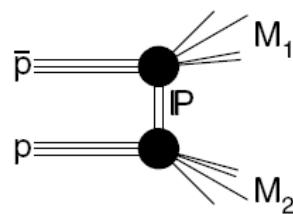

figure from a talk by Edmond Iancu

# DD at CDF

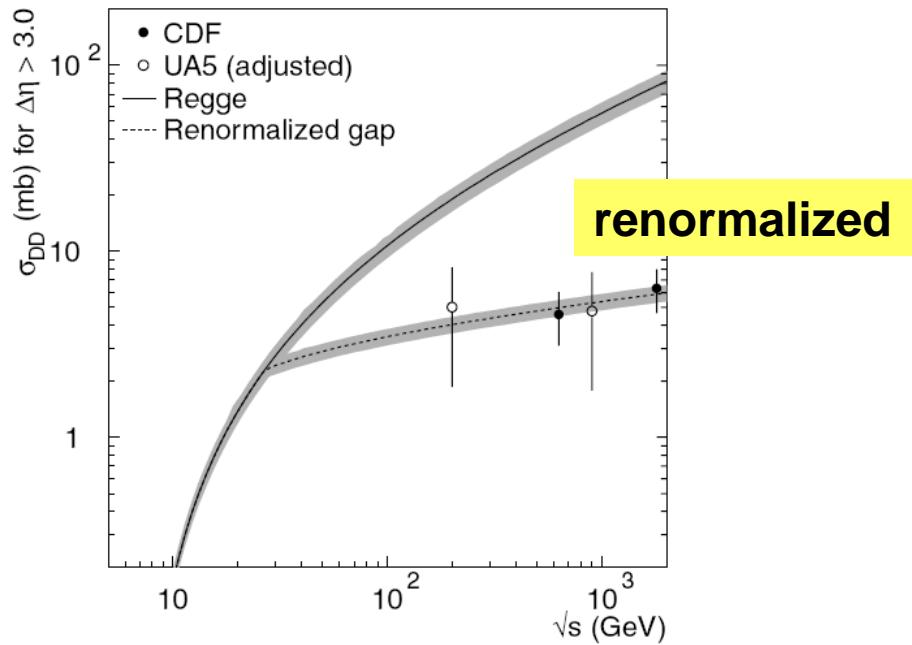

$$\frac{d^3\sigma_{\text{DD}}}{dt dM_1^2 dM_2^2} = \frac{d^2\sigma_{\text{SD}}}{dt dM_1^2} \frac{d^2\sigma_{\text{SD}}}{dt dM_2^2} \Big/ \frac{d\sigma_{el}}{dt}$$

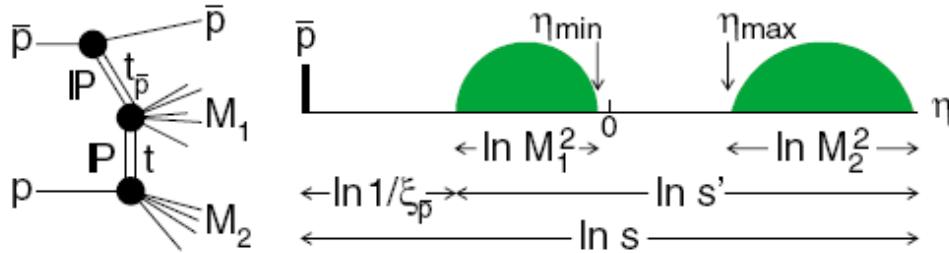

$$= \frac{[\kappa \beta_1(0) \beta_2(0)]^2}{16\pi} \frac{s^{2\epsilon} e^{b_{\text{DD}} t}}{(M_1^2 M_2^2)^{1+2\epsilon}}$$

$$\frac{d^3\sigma_{\text{DD}}}{dt d\Delta\eta d\eta_c} = \left[ \frac{\kappa \beta^2(0)}{16\pi} e^{2[\alpha(t)-1]\Delta\eta} \right] \left[ \kappa \beta^2(0) \left( \frac{s'}{s_0} \right)^\epsilon \right]$$

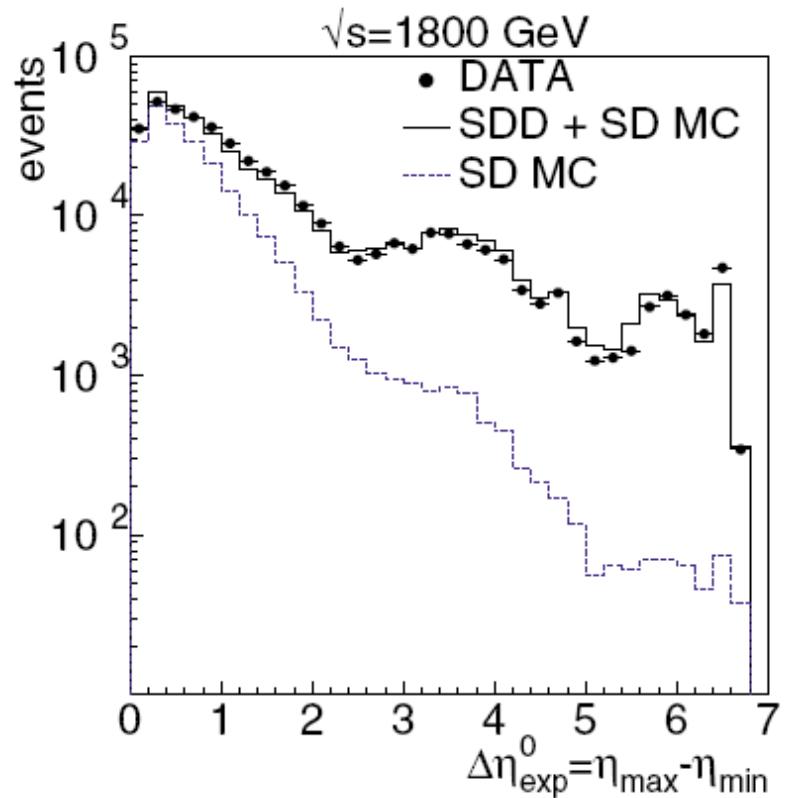

gap probability      x-section

# SDD at CDF

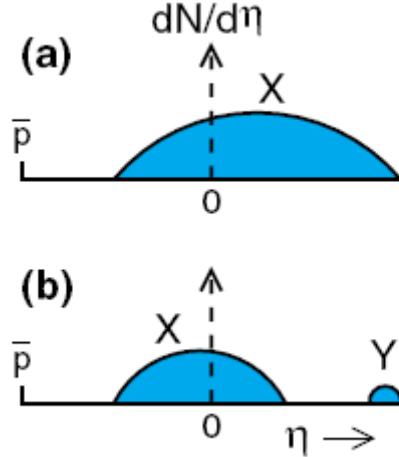

- Excellent agreement between data and MBR (MinBiasRockefeller) MC

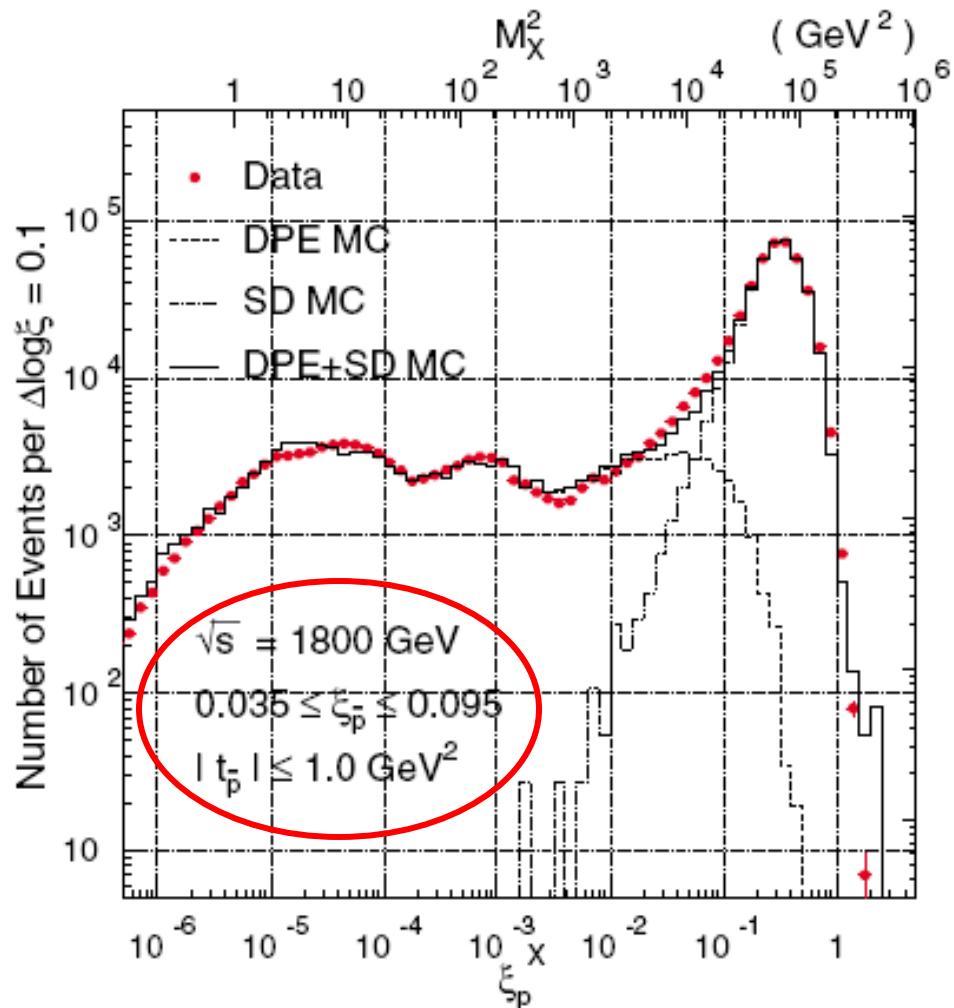

$$\frac{d^5\sigma}{dt_{\bar{p}} dt d\xi_{\bar{p}} d\Delta\eta d\eta_c} = \left[ \frac{\beta(t)}{4\sqrt{\pi}} e^{[\alpha(t_{\bar{p}})-1]\ln(1/\xi)} \right]^2 \times \kappa \left\{ \kappa \left[ \frac{\beta(0)}{4\sqrt{\pi}} e^{[\alpha(t)-1]\Delta\eta} \right]^2 \kappa \left[ \beta^2(0) \left( \frac{s''}{s_o} \right)^{\epsilon} \right] \right\}$$

# CD/DPE at CDF

- Excellent agreement between data and MBR
- low and high masses are correctly implemented

# Diffractive x-sections

$$\begin{aligned}
 \frac{d^2\sigma_{SD}}{dt d\Delta y} &= \frac{1}{N_{\text{gap}}(s)} \left[ \frac{\beta^2(t)}{16\pi} e^{2[\alpha(t)-1]\Delta y} \right] \cdot \left\{ \kappa \beta^2(0) \left( \frac{s'}{s_0} \right)^\epsilon \right\}, \\
 \frac{d^3\sigma_{DD}}{dt d\Delta y dy_0} &= \frac{1}{N_{\text{gap}}(s)} \left[ \frac{\kappa \beta^2(0)}{16\pi} e^{2[\alpha(t)-1]\Delta y} \right] \cdot \left\{ \kappa \beta^2(0) \left( \frac{s'}{s_0} \right)^\epsilon \right\}, \\
 \frac{d^4\sigma_{DPE}}{dt_1 dt_2 d\Delta y dy_c} &= \frac{1}{N_{\text{gap}}(s)} \left[ \prod_i \left[ \frac{\beta^2(t_i)}{16\pi} e^{2[\alpha(t_i)-1]\Delta y_i} \right] \right] \cdot \kappa \left\{ \kappa \beta^2(0) \left( \frac{s'}{s_0} \right)^\epsilon \right\}
 \end{aligned}$$

$$\beta^2(t) = \beta^2(0) F^2(t)$$

$$F^2(t) = \left[ \frac{4m_p^2 - 2.8t}{4m_p^2 - t} \left( \frac{1}{1 - \frac{t}{0.71}} \right)^2 \right]^2 \approx a_1 e^{b_1 t} + a_2 e^{b_2 t}$$

$\alpha_1=0.9$ ,  $\alpha_2=0.1$ ,  $b_1=4.6 \text{ GeV}^{-2}$ ,  $b_2=0.6 \text{ GeV}^{-2}$ ,  $s'=s e^{-\Delta y}$ ,  $\kappa=0.17$ ,  
 $\kappa \beta^2(0)=\sigma_0$ ,  $s_0=1 \text{ GeV}^2$ ,  $\sigma_0=2.82 \text{ mb or } 7.25 \text{ GeV}^{-2}$

# Total, elastic, and inelastic x-sections

$$\sigma_{\text{ND}} = (\sigma_{\text{tot}} - \sigma_{\text{el}}) - (2\sigma_{\text{SD}} + \sigma_{\text{DD}} + \sigma_{\text{CD}})$$

CMG

R. J. M. Covolan, K. Goulianatos, J. Montanha, Phys. Lett. B 389, 176 (1996)

$$\sigma_{\text{tot}}^{p\pm p} = \begin{cases} 16.79s^{0.104} + 60.81s^{-0.32} \mp 31.68s^{-0.54} & \text{for } \sqrt{s} < 1.8 \\ \sigma_{\text{tot}}^{\text{CDF}} + \frac{\pi}{s_0} \left[ \left( \ln \frac{s}{s_F} \right)^2 - \left( \ln \frac{s^{\text{CDF}}}{s_F} \right)^2 \right] & \text{for } \sqrt{s} \geq 1.8 \end{cases}$$

KG Moriond 2011, arXiv:1105.1916

$$\sqrt{s^{\text{CDF}}} = 1.8 \text{ TeV}, \sigma_{\text{tot}}^{\text{CDF}} = 80.03 \pm 2.24 \text{ mb}$$

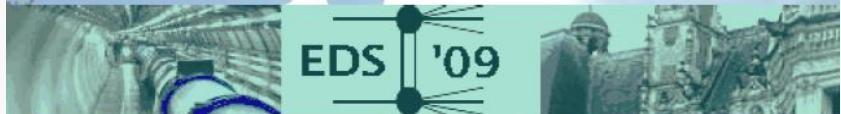

$$\sqrt{s_F} = 22 \text{ GeV} \quad s_0 = 3.7 \pm 1.5 \text{ GeV}^2$$

$\sigma_{\text{el}}^{p\pm p} = \sigma_{\text{tot}} \times (\sigma_{\text{el}}/\sigma_{\text{tot}})$ , with  $\sigma_{\text{el}}/\sigma_{\text{tot}}$  from CMG  
small extrapol. from 1.8 to 7 and up to 50 TeV )

# Diffractive and Total pp Cross Sections at LHC

Konstantin Goulianatos  
The Rockefeller University

- Use the Froissart formula as a *saturated* cross section

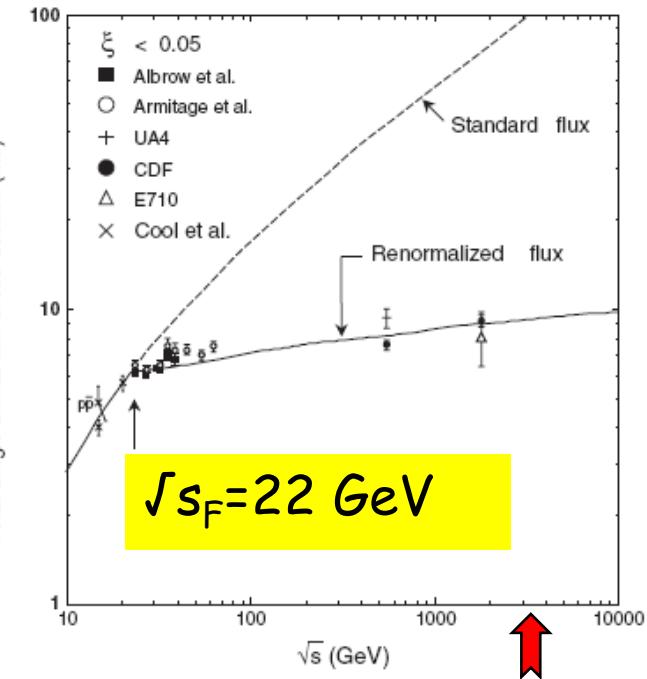

$$\sigma_t(s > s_F) = \sigma_t(s_F) + \frac{\pi}{m^2} \cdot \ln^2 \frac{s}{s_F}$$

- This formula should be valid above the *knee* in  $\sigma_{sd}$  vs.  $\sqrt{s}$  at  $\sqrt{s}_F = 22$  GeV (Fig. 1) and therefore valid at  $\sqrt{s} = 1800$  GeV.
- Use  $m^2 = s_o$  in the Froissart formula multiplied by  $1/0.389$  to convert it to  $\text{mb}^{-1}$ .
- Note that contributions from Reggeon exchanges at  $\sqrt{s} = 1800$  GeV are negligible, as can be verified from the global fit of Ref. [7].
- Obtain the total cross section at the LHC:

$$\sigma_t^{\text{LHC}} = \sigma_t^{\text{CDF}} + \frac{\pi}{s_o} \cdot \left( \ln^2 \frac{s^{\text{LHC}}}{s_F} - \ln^2 \frac{s^{\text{CDF}}}{s_F} \right)$$

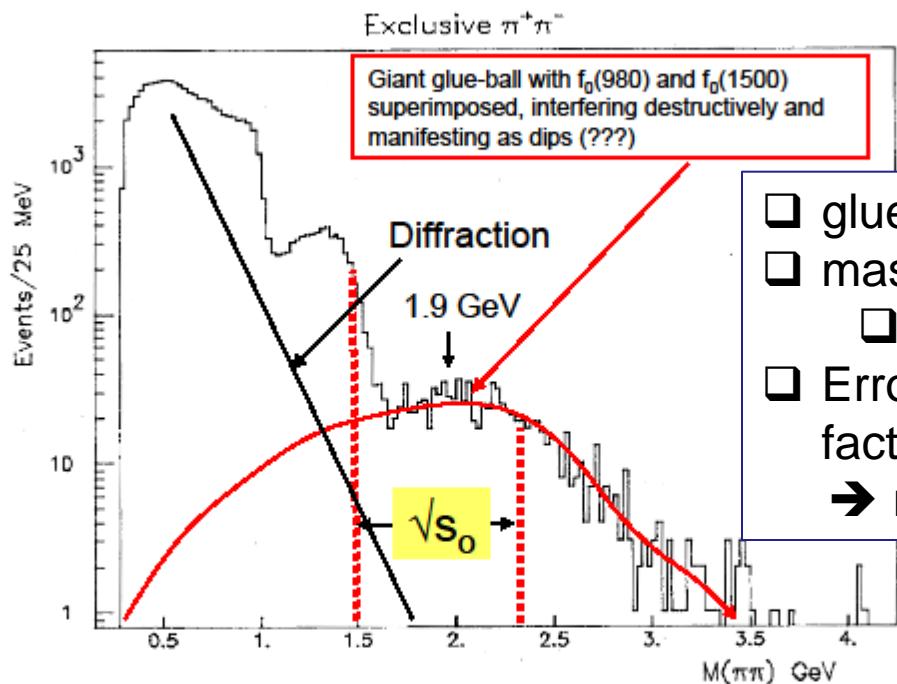

**98 ± 8 mb at 7 TeV**  
**109 ± 12 mb at 14 TeV**

Main error  
from  $s_0$

# Reduce the uncertainty in $s_0$

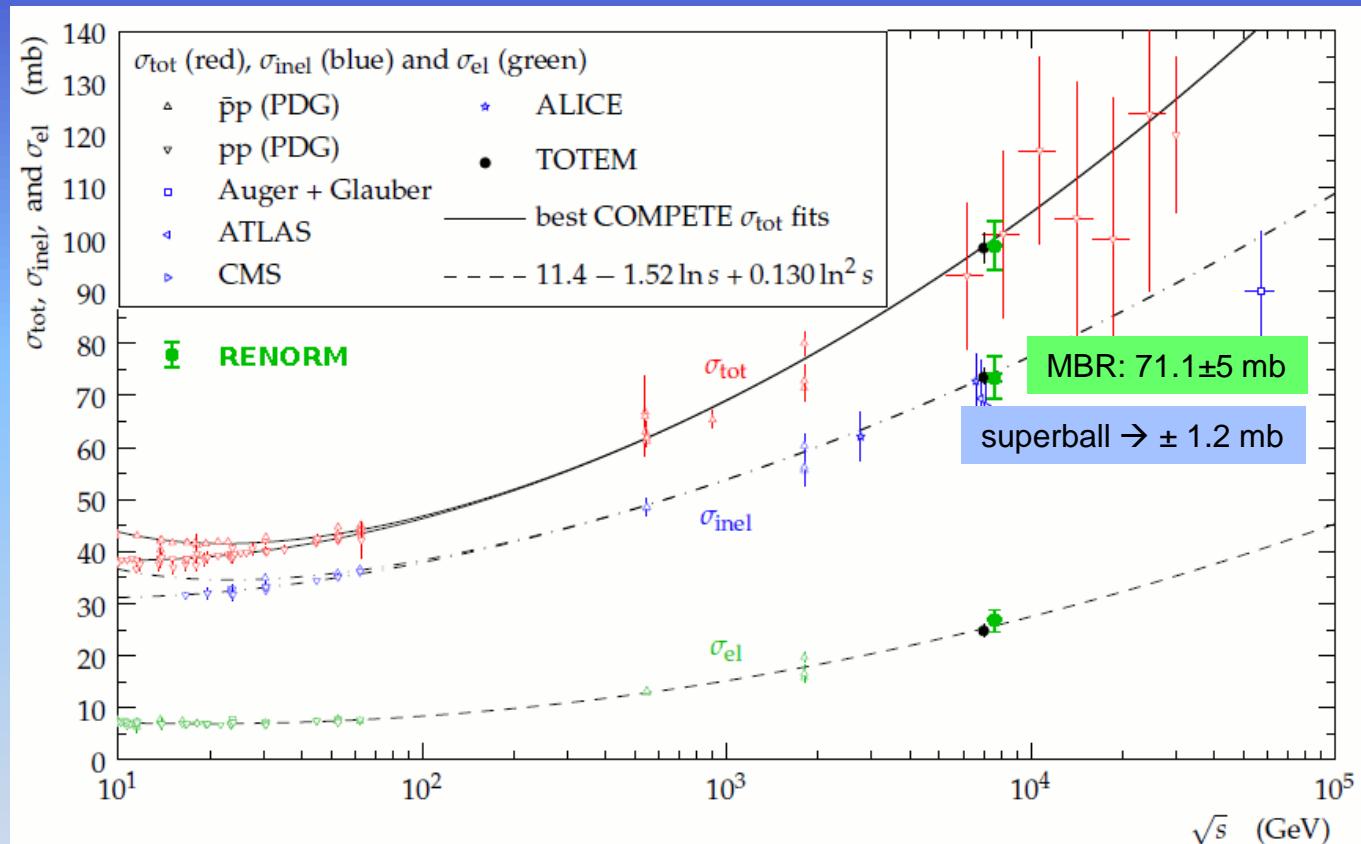

## Saturation glueball?

- glue-ball-like object → “superball”
- mass → 1.9 GeV →  $m_s^2 = 3.7$  GeV
- agrees with RENORM  $s_0 = 3.7$
- Error in  $s_0$  can be reduced by factor ~4 from a fit to these data!  
→ reduces error in  $\sigma_t$ .

Figure 8:  $M_{\pi^+\pi^-}$  spectrum in *DIF-E* at the ISR (Axial Field Spectrometer, RS07 [97, 98]). Figure from Ref. [98]. **See M.G.Albrow, T.D. Goughlin, J.R. Forshaw, hep-ph>arXiv:1006.1289**

# TOTEM vs PYTHIA8-MBR

$$\sigma_{\text{inrl}}^{7 \text{ TeV}} = 72.9 \pm 1.5 \text{ mb}$$

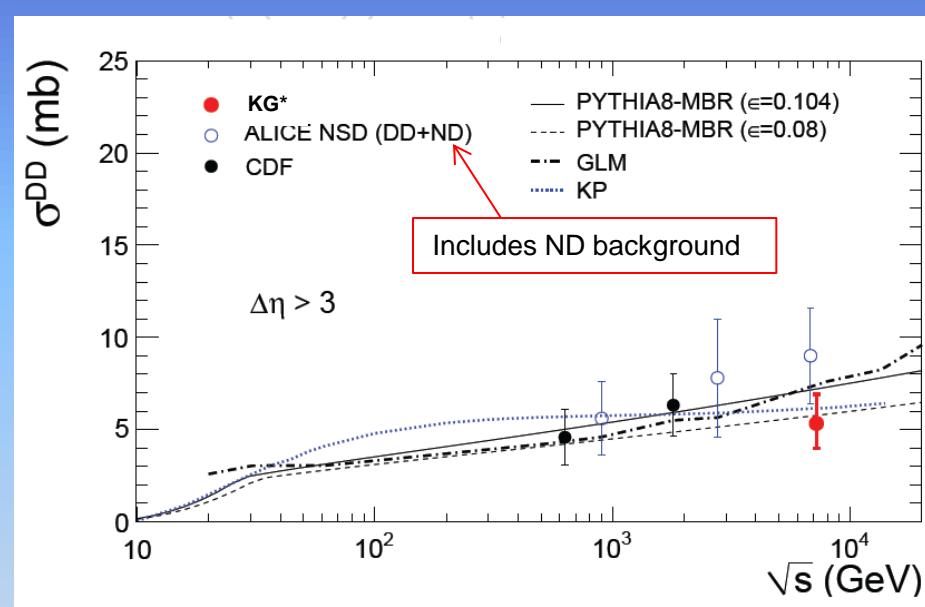

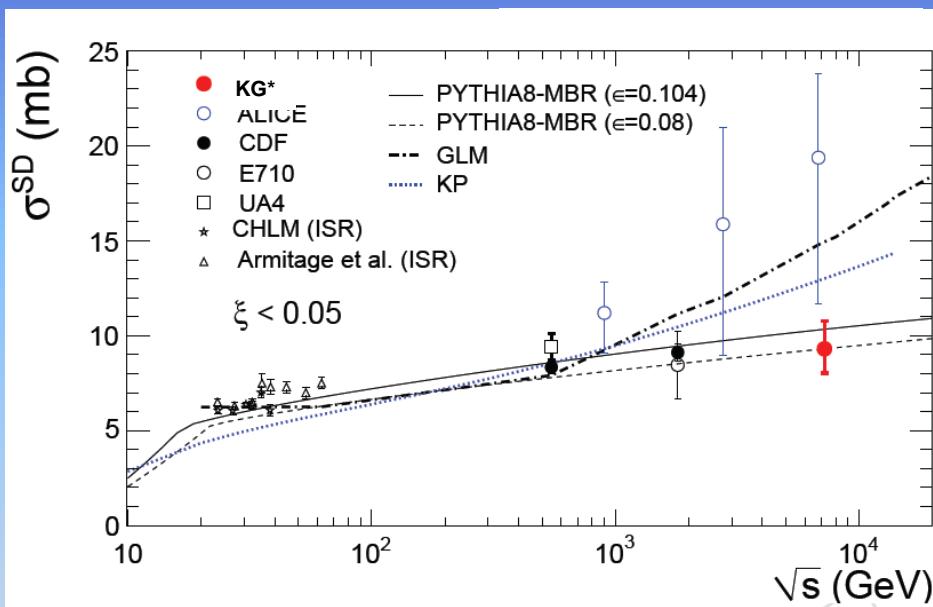

$$\sigma_{\text{inrl}}^{8 \text{ TeV}} = 74.7 \pm 1.7 \text{ mb}$$

*TOTEM, G. Latino talk at MPI@LHC, CERN 2012*

RENNORM:  $71.1 \pm 1.2$  mb

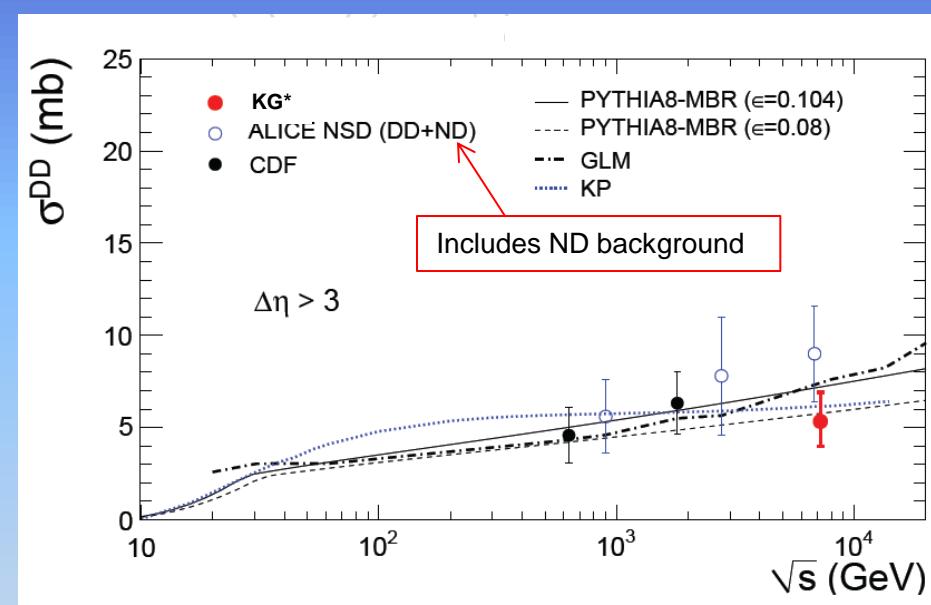

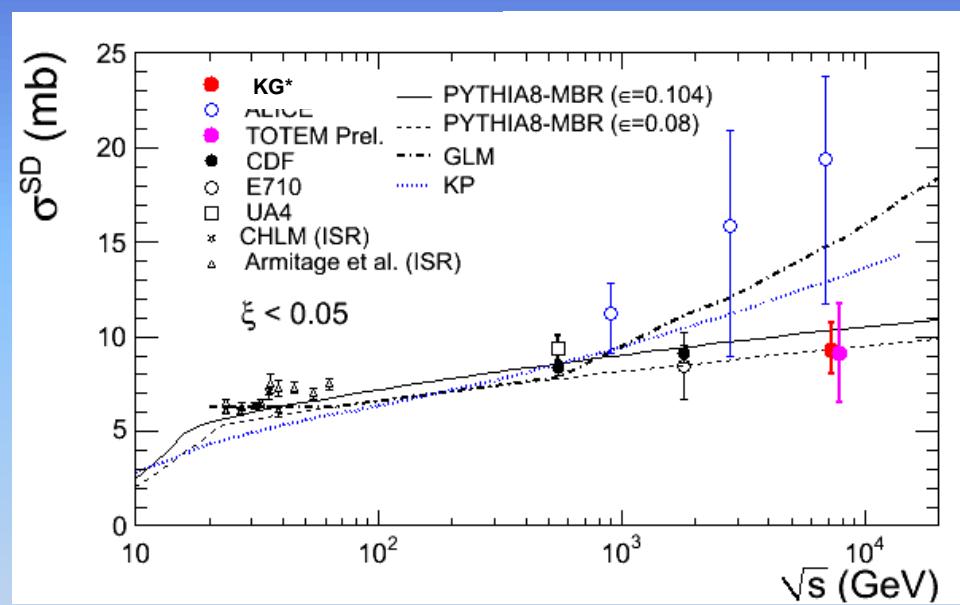

RENNORM:  $72.3 \pm 1.2$  mb

# CMS SD and DD x-sections vs ALICE: measurements and theory models

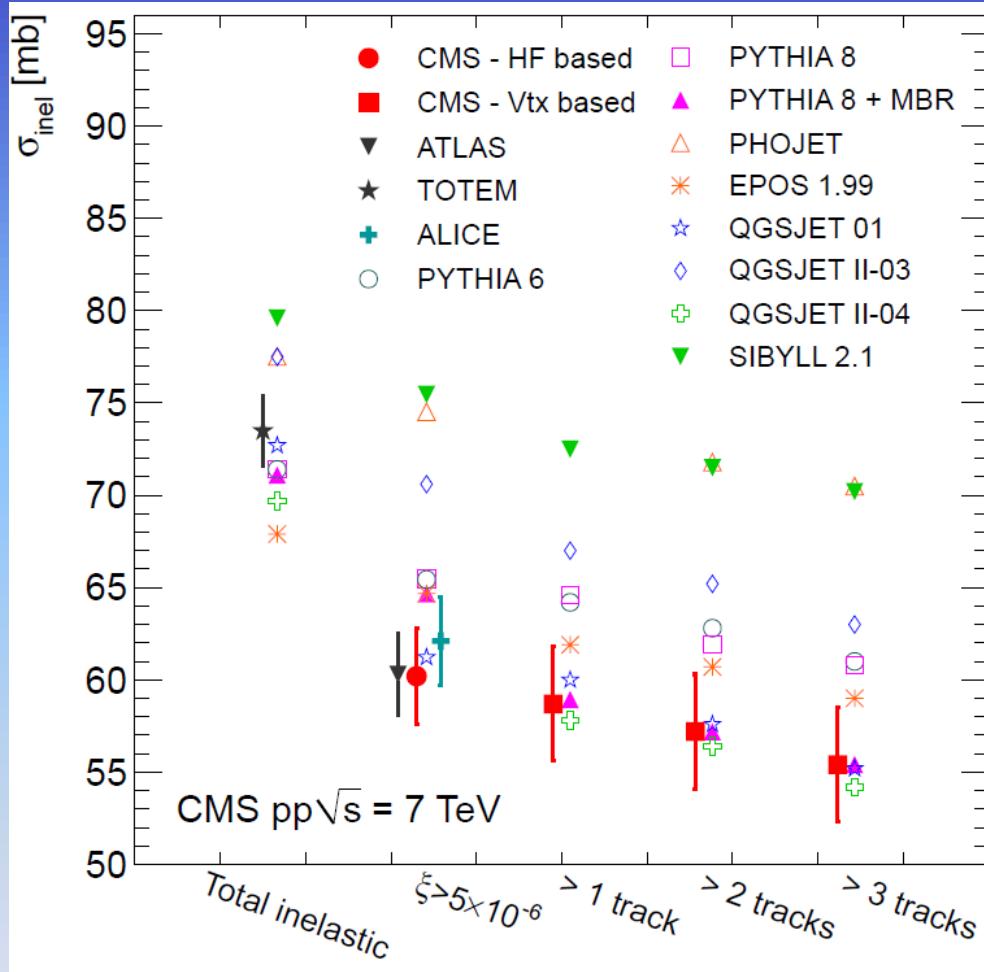

- KG\*: after extrapolation into low  $\xi$  from measured CMS data using the MBR model:  
find details on data in Benoit Roland's talk on Sunday at 09:05.

# CMS SD and DD x-sections vs ALICE: measurements and theory models

- KG\*: after extrapolation into low  $\xi$  from measured CMS data using the MBR model:  
find details on data in Benoit Roland's talk on Sunday at 09:05.

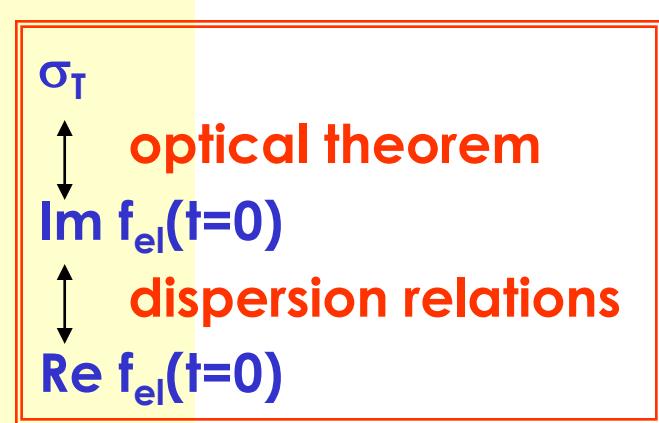

# Total-Inelastic Cross Sections vs model predictions

# Monte Carlo Strategy for the LHC ...

## MONTE CARLO STRATEGY

- $\sigma_{\text{tot}} \rightarrow$  from SUPERBALL model
- optical theorem  $\rightarrow \text{Im } f_{\text{el}}(t=0)$
- dispersion relations  $\rightarrow \text{Re } f_{\text{el}}(t=0)$
- $\sigma_{\text{el}} \leftarrow$  using global fit
- $\sigma_{\text{inel}} = \sigma_{\text{tot}} - \sigma_{\text{el}}$
- differential  $\sigma_{\text{SD}} \rightarrow$  from RENORM
- use *nesting* of final states for  
 $p\bar{p}$  collisions at the  $P$ - $p$  sub-energy  $\sqrt{s'}$

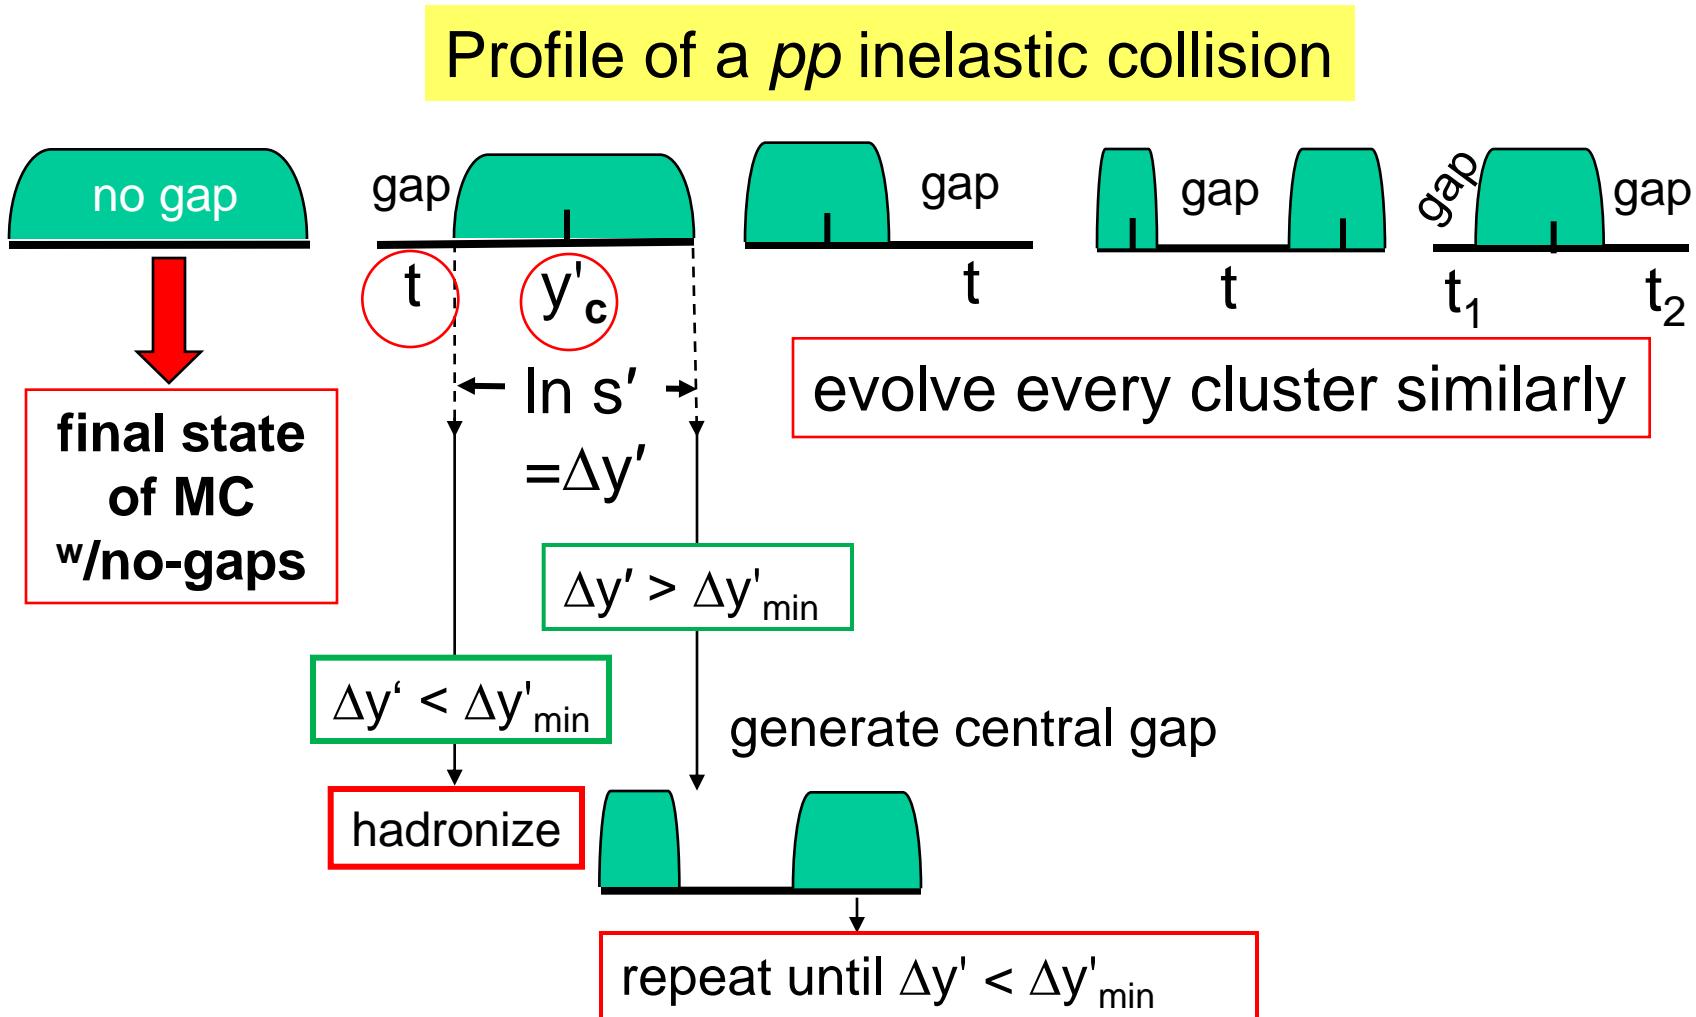

Strategy similar to that of MBR used in CDF based on multiplicities from:

K. Goulianatos, Phys. Lett. B 193 (1987) 151 pp

“A new statistical description of hardonic and  $e^+e^-$  multiplicity distributions”

# Monte Carlo algorithm - nesting

# SUMMARY

- Introduction
- Diffractive cross sections:
  - basic: SD1,SD2, DD, CD (DPE)
  - combined: multigap x-sections
  - ND → no diffractive gaps:
    - ❖ this is the only final state to be tuned
- Total, elastic, and total inelastic cross sections
- Monte Carlo strategy for the LHC – “nesting”

*Thank you for your attention*
